SUMMARY

Full Stack Developer with 3+ years building and owning data-intensive web applications end to end. Strongest in React, NestJS, and TypeScript. Sole developer of a satellite-network monitoring platform serving 241 enterprise customers across banking, telecom, defense, and IT, tracking 100K+ provisioned devices and 64K+ active links. Hands-on with dual-database architecture (MongoDB + TimescaleDB), time-series telemetry, real-time NOC dashboards, third-party API integrations, and 7-role RBAC. Also built the field-engineer mobile app for the same platform in React Native (Expo). Builds LLM features with the Claude and Gemini APIs, including a RAG app over NASA data, and works AI-first daily (Claude Code, Cursor, Copilot).

SKILLS

Frontend: React, TypeScript, JavaScript, Vite, Material UI, data visualization (charts, maps), responsive ERP-style UIs
Mobile: React Native (Expo), expo-router, zustand, react-native-paper, barcode/QR scanning, push notifications, biometric auth
Backend: Node.js, NestJS, Fastify, REST APIs, cron-based automation, role-based access control
AI: LLM APIs (Anthropic Claude, Google Gemini), RAG and vector search, prompt design, AI content pipelines, SentiSight.ai image analytics; AI-assisted dev (Claude Code, Cursor, Copilot, Codex, Antigravity)
Data: MongoDB, TimescaleDB (PostgreSQL), PostgreSQL + pgvector, time-series querying, CSV report generation
Tooling: Docker Compose (MongoDB, TimescaleDB, Postgres), Caddy, Git, GitLab (3+ yrs), Jest, Android device testing (wireless adb), production debugging, Figma-to-UI

EXPERIENCE

KSDAC LLP · Full Stack Developer (Remote)
04/2023 · Present

- Sole developer and owner of a network-monitoring platform for a satellite-communications client, responsible for frontend, backend, database design, release support, and first response for production data issues affecting enterprise customers.
- Built an automated integration with the client's third-party service providers, syncing device-disconnection data via API every 30 minutes. Replaced manual coordination across field engineers, billing, and support, cutting customer disconnection turnaround from weeks to under a day and eliminating recurring data-mismatch errors.
- Designed a dual-database architecture: MongoDB (~15 collections) for device, customer, sub-customer, and satellite metadata; TimescaleDB (PostgreSQL) for high-frequency telemetry such as live bandwidth and RF signal readings.
- Built the real-time NOC dashboard (online/offline trends, 99.97% portfolio availability, offline-device categorization) and per-device drilldowns with RF signal-vs-threshold charts, availability history, and LEO terminal path tracking on Leaflet maps.
- Designed and implemented 7-role RBAC with hierarchical data isolation between customers and sub-customers, enforced at the API layer.
- Migrated the legacy REST API codebase to NestJS and TypeScript in a monorepo, introducing end-to-end type safety across API contracts.
- Rebuilt the legacy Ionic field-engineer app in React Native (Expo, TypeScript): OTP + biometric login, service-order lookup, GPS-stamped site arrival, and resumable step-by-step install guides per medium (VSAT, SIM, UBR, broadband) with safety checks and photo capture.
- Added barcode/QR scanning for serials and SIM ICCIDs, AI photo validation through SentiSight.ai image analytics with NOC escalation after repeated failures, push-notified sign-off, and signed completion certificates, backed by NestJS/Fastify APIs.

Prospectss · JavaScript Developer (Remote)
09/2022 · 12/2022

- Developed browser extensions for a paid SaaS platform, handling dynamic content and site-specific rendering constraints.
- Built and maintained a credit-based metering system where each user operation consumed billed credits.

Crosscope · Frontend Developer Intern (Remote)
01/2022 · 04/2022

- Built core UI modules (dashboard, authentication, account management) for an AI-driven cancer-treatment healthcare platform using React, Material UI, Formik, and Axios.

PROJECTS

Solar-kb · RAG Q&A over NASA Data (personal project)
2026

- RAG chatbot that answers only from ~270 NASA pages, cites sources and refuses off-topic questions (30/30 on its eval). Postgres/pgvector, Groq with a Claude fallback, React + Three.js 3D solar system, NestJS API with Google sign-in and daily limits, Docker + Caddy HTTPS. Live: solarkb.com · Code: github.com/chiragmandyal1/solar-kb

EDUCATION

B.Tech, Computer Science & Engineering · Uttaranchal University, Dehradun *Graduated 04/2022*
CGPA: 8.4/10
